## CONTENTS

- INTRODUCTION/MOTIVATION
- OBSERVERS AND THERMAL PROPAGATORS
- COSMOLOGICAL OBSERVABLES FROM THERMAL EFFECTS
- COSMOLOGICAL OBSERVABLES FROM dS/CFT
- CONCLUSIONS

## INTRO

- Inflation:

> 1) An elegant explanation for the homogeneity and isotropy of the Universe
> 2) A causal mechanism to generate the inhomogeneities

- The anisotropies leave their imprints on CMB
- Precise measurements of CMB's anisotropies and spectral index provide a test-playground for inflation

Planck Collaboration, r. Akrami et<br>al., Astron. Astrophys. 641 (2020)

## INTRO

- Inflation works very well for a slowly rolling scalar field with

$$
\dot{\phi}^{2}<V(\phi)
$$

$$
n_{\mathrm{S}} \simeq\left(1-4 \epsilon_{\mathrm{H}}+2 \delta_{\mathrm{H}}\right)
$$

- For a (not so simple) choice of potential and a (not so) small amount of fine tuning (in $\epsilon_{H}$ and $\delta_{H}$ ) $n_{S}$ matches its experimental value

$$
0.9649 \pm 0.0042 \text { at } 68 \% C L
$$

Planck Collaboration, r. Akrami et al., Astron. Astrophys. 641 (2020)

## INTRO

- What about the simplest monomial Inflaton potential?
- Our proposal

Free massive scalar field and its thermal evolution under the dS/ CFT correspondence

- The FLRW metric

$$
d s^{2}=a^{2}\left(d \tau^{2}-d \mathbf{x}^{2}\right) \quad H=\frac{\dot{a}}{a^{2}}
$$

For the expanding Poincare patch of de Sitter

## A BIT OF TERMINOLOGY

- QFT in dS space:

Conformally flat metric with a time-like coordinate $\tau \in(-\infty, 0]$

$$
d s^{2}=a^{2}\left(d \tau^{2}-d \mathbf{x}^{2}\right) \quad \text { and } \quad \alpha(\tau)=-\frac{1}{H \tau}
$$

$\mid$ in $\rangle$ vacuum (observer) defined at $\tau \rightarrow-\infty$
$\mid$ out $\rangle$ vacuum (observer) defined at the horizon $\tau=0$ $\begin{array}{rc}\langle J| \Phi^{I}=\langle I| \Phi^{J} & \begin{array}{c}\text { Bogolyubov } \\ \text { Transformation }\end{array} \\ I, J=\mathrm{in} \text {, out } & \end{array}$

- The $\tau=0$ surface is also called the Horizon of the expanding Poincare patch of dS space

## THERMAL PROPAGATORS

- The action to be quantized under thermal effects

$$
\mathcal{S}=\int d^{4} x \sqrt{-g}\left[\frac{1}{2} g^{\mu \nu} \partial_{\mu} \phi \partial_{\nu} \phi-\frac{1}{2}\left(m^{2}+\xi \mathcal{R}\right) \phi^{2}\right]
$$

- Consider a $d+1$ dimensional FLRW spacetime

$$
d s^{2}=a^{2}\left(d \tau^{2}-d \mathbf{x}^{2}\right)
$$

- Klein-Gordon equation for the mode $\phi_{\mathbf{k}}=\frac{\chi_{\mathbf{k}}}{\alpha}$

$$
\ddot{\chi}_{\mathbf{k}}+\omega_{|\mathbf{k}|}^{2} \chi_{\mathbf{k}}=0
$$

$$
\omega_{|\mathbf{k}|}^{2}(\tau)=|\mathbf{k}|^{2}+m_{\mathrm{dS}}^{2}(\tau)
$$

$$
m_{\mathrm{dS}}^{2}(\tau)=\frac{1}{\tau}\left(M^{2}-\frac{d^{2}-1}{4}\right), M^{2}=\frac{m^{2}}{H^{2}}+12 \xi
$$

## THERMAL PROPAGATORS

- The solution is a combination of the Hankel functions $H_{\nu_{c l}}^{1,2}(\tau,|\mathbf{k}|)$ with weight

$$
\nu_{\mathrm{cl}}=\frac{d}{2} \sqrt{1-\frac{4 M^{2}}{d^{2}}}
$$

- Quantization includes time-dependent vacua and a doubled Hilbert space
- Time-dependent vacua
$\mid$ in> vacuum is empty for the "in" observer (Bunch-Davies vacuum)
N. A. Chernikov and E. A. Tagirov, '68 B. Allen, Phys. Rev. D32 (1985) 3136
|out vacuum is empty for the "out" observer

## THERMAL PROPAGATORS

- Doubled Hilbert space

## THERMAL PROPAGATORS

- The $T=0\left(C_{3}=0\right)$ "in-in" field propagator

$$
\mathcal{D}=\begin{array}{|ll|ll|}
\hline\langle 0| \mathcal{T}\left[\Phi^{+}\left(\tau_{1}\right) \Phi^{+}\left(\tau_{2}\right)\right]|0\rangle & =\mathcal{D}_{++}\left(\tau_{1} ; \tau_{2}\right) & \langle 0| \Phi^{-}\left(\tau_{1}\right) \Phi^{+}\left(\tau_{2}\right)|0\rangle=\mathcal{D}_{+-}\left(\tau_{1} ; \tau_{2}\right) \\
\hline\langle 0| \Phi^{+}\left(\tau_{2}\right) \Phi^{-}\left(\tau_{1}\right)|0\rangle=\mathcal{D}_{-+}\left(\tau_{1} ; \tau_{2}\right) & \langle 0| \mathcal{T}^{*}\left[\Phi^{-}\left(\tau_{1}\right) \Phi^{-}\left(\tau_{2}\right)\right]|0\rangle=\mathcal{D}_{--}\left(\tau_{1} ; \tau_{2}\right) \\
\hline
\end{array}
$$

$$
\begin{gathered}
\mathcal{D}_{-+}\left(\tau_{1} ; \tau_{2}\right)=\chi_{|\mathbf{k}|}\left(\tau_{1}\right) \chi_{|\mathbf{k}|}^{*}\left(\tau_{2}\right) \\
\mathcal{D}_{+-}\left(\tau_{1} ; \tau_{2}\right)=\mathcal{D}_{-+}^{*}\left(\tau_{1} ; \tau_{2}\right), \mathcal{D}_{--}\left(\tau_{1} ; \tau_{2}\right)=\mathcal{D}_{++}^{*}\left(\tau_{1} ; \tau_{2}\right) \\
\mathcal{D}_{++}\left(\tau_{1} ; \tau_{2}\right)=\theta\left(\tau_{1}-\tau_{2}\right) \mathcal{D}_{-+}\left(\tau_{1} ; \tau_{2}\right)+\theta\left(\tau_{2}-\tau_{1}\right) \mathcal{D}_{+-}\left(\tau_{1} ; \tau_{2}\right)
\end{gathered}
$$

- The flat space limit propagator

$$
\mathcal{D}_{++}=\frac{i}{k^{2}-m^{2}+i \varepsilon}
$$

## THERMAL PROPAGATORS

- What about the "out-out" field propagator?
- Connected with the $C_{3} \neq 0$ contour
- One should make sure that the KMS condition for thermal equilibrium is satisfied

## THERMAL PROPAGATORS

$\Phi^{3}(\tau)$ defined on $C_{3}$

$$
\begin{aligned}
& \langle 0| \mathcal{T}\left[\Phi^{3}\left(\tau_{1}\right) \Phi^{3}\left(\tau_{2}\right)\right]|0\rangle=\mathcal{D}_{33}\left(\tau_{1} ; \tau_{2}\right) \\
& \langle 0| \Phi^{+}\left(\tau_{1}\right) \Phi^{3}\left(\tau_{2}\right)|0\rangle=\mathcal{D}_{3+}\left(\tau_{1} ; \tau_{2}\right) \\
& \langle 0| \Phi^{-}\left(\tau_{1}\right) \Phi^{3}\left(\tau_{2}\right)|0\rangle=\mathcal{D}_{3-}\left(\tau_{1} ; \tau_{2}\right)
\end{aligned}
$$

Satisfy the sewing conditions

$$
\text { for } a \in\{-,+, 3\}
$$

$$
\left.\mathcal{D}_{a-}\left(\tau_{1} ; \tau_{2}\right)\right|_{\tau_{2}=\tau_{\mathrm{in}}}=\left.\left.\mathcal{D}_{a 3}\left(\tau_{1} ; \tau_{2}\right)\right|_{\tau_{2}=\tau_{\mathrm{in}}} \quad \frac{\partial}{\partial \tau_{2}} \mathcal{D}_{a-}\left(\tau_{1} ; \tau_{2}\right)\right|_{\tau_{2}=\tau_{\mathrm{in}}}=\left.\frac{\partial}{\partial \tau_{2}} \mathcal{D}_{a 3}\left(\tau_{1} ; \tau_{2}\right)\right|_{\tau_{2}=\tau_{\mathrm{in}}}
$$

## THERMAL PROPAGATORS

- The $T \neq 0\left(C_{3} \neq 0\right)$ "out-out" field propagator

$$
\mathcal{D}_{\beta / 2}=\begin{array}{|c|c|}
\hline \mathcal{D}_{++}+n_{B}(\beta / 2)\left(\mathcal{D}_{++}+\mathcal{D}_{--}\right) & \mathcal{D}_{+-}+n_{B}(\beta / 2)\left(\mathcal{D}_{++}+\mathcal{D}_{--}\right) \\
\hline \mathcal{D}_{-+}+n_{B}(\beta / 2)\left(\mathcal{D}_{++}+\mathcal{D}_{--}\right) & \mathcal{D}_{--}+n_{B}(\beta / 2)\left(\mathcal{D}_{++}+\mathcal{D}_{--}\right) \\
\hline
\end{array}
$$

- the Bose-Einstein distribution parameter

$$
n_{B}(\beta)=\frac{e^{-\beta \omega_{|\mathbf{k}|}}}{1-e^{-\beta \omega_{|\mathbf{k}|}}}
$$

## THERMAL PROPAGATORS

- Concrete $T \neq 0\left(C_{3} \neq 0\right)$ "out-out" field propagator should respect the KMS condition
- Proof that Schwinger-Keldysh $\equiv$ Thermofield dynamics for time-dependent Hamiltonian via "in-in"

| $\mathcal{D}_{\beta}=U_{\beta} \mathcal{D} U_{\beta}^{T}$ |  |
| :---: | :---: |
| $\beta=\frac{1}{T}$ |  |

$$
\begin{gathered}
\text { A Bogolyubov Transformation (BT) with coefficients } \\
\cosh \theta_{|\mathbf{k}|}=\frac{1}{\sqrt{1-e^{-\beta \omega_{|\mathbf{k}|}}}} \text { and } \sinh \theta_{|\mathbf{k}|}=\sqrt{\cosh ^{2} \theta_{|\mathbf{k}|}-1}
\end{gathered}
$$

## THERMAL PROPAGATORS

- All the allowed thermal transformations of $\mathcal{D}$ are correlators of the form

$$
\mathcal{D}_{J, \alpha}^{I}=\langle J ; \alpha| \mathcal{T}\left[\boldsymbol{\Phi}^{I}\left(\boldsymbol{\Phi}^{I}\right)^{T}\right]|J ; \alpha\rangle
$$

- In Thermofield dynamics language $\left(\boldsymbol{\Phi}^{I}\right)^{T}=\left(\Phi^{+, I} / \Phi^{-, I}\right)$ with $I, J=$ in, out. $\alpha$ is a thermal index

$$
\text { Exact } d S \text { space can only suftain the } G \text { - } H \text { temperature }
$$

$$
\frac{1}{\beta}=T-T_{\mathrm{dS}}=\frac{H}{2 \pi}
$$

- The thermal dS-scalar propagator admits an explicit and compact form

$$
\mathcal{D}_{\beta}=\mathcal{D}+\left(\mathcal{D}_{++}+\mathcal{D}_{++}^{*}\right)\left(s^{2}+s c\right)\left(\begin{array}{ll}
1 & 1 \\
1 & 1
\end{array}\right)
$$

$$
\begin{aligned}
& s \equiv \sinh \theta_{|\mathbf{k}|} \\
& c \equiv \cosh \theta_{|\mathbf{k}|}
\end{aligned}
$$

## THE COSMOLOGICAL OBSERVABLES

- The thermal power spectrum for $\tau_{1}=\tau_{2}, H|\tau|=1$ and $|\mathbf{k} \tau| \lesssim 1$

$$
\mathcal{D}_{\beta}=\mathcal{D}+\left(\mathcal{D}_{++}+\mathcal{D}_{++}^{*}\right)\left(s^{2}+s c\right)\left(\begin{array}{ll}
1 & 1 \\
1 & 1
\end{array}\right)
$$

- Defines the observables $n_{S}, n_{S}^{\prime}, n_{S}^{\prime \prime}$ and $f_{N L}$
$\mathbf{1}$ is the $2 \times 2$ matrix with unit elements

$$
\begin{aligned}
\left.\kappa \equiv \omega_{|\mathbf{k}|}|\tau|\right|_{|\mathbf{k} \tau|=1} & =\left.\sqrt{\left(|\mathbf{k}|^{2}+m_{\mathrm{dS}}^{2}\right)|\tau|^{2}}\right|_{|\mathbf{k} \tau|=1} \\
& =\sqrt{\frac{5-d^{2}}{4}+M^{2}}
\end{aligned}
$$

- The picture
$\mathcal{D} \longrightarrow \mathcal{D}_{\beta} \longleftrightarrow \quad \mid$ in $>\longrightarrow \mid$ out,$\beta>$

## THE COSMOLOGICAL OBSERVABLES

- Time-independent BT
$\mid$ in $>\longrightarrow \mid$ out, $\beta_{T_{\mathrm{dS}}}>\longrightarrow$ Exact de Sitter $\longrightarrow d=3, M^{2}=0 \rightarrow \kappa=i$
P. R. Anderson, C. Molina-Paris and Emil Mottola, Phys. Rev. D 72 (2005) 043515 P. R. Anderson and E. Mottola, Phys. Rev. D 89 (2014) 104038

$$
P_{S}(\tau)=\left(\frac{H}{2 \pi}\right)^{2}(1+|\mathbf{k} \tau|) \Rightarrow P_{S}(0)=\left(\frac{H}{2 \pi}\right)^{2}
$$

scale invariant spectrum

- Time-dependent BT
$\mid$ in $>\longrightarrow \mid$ out, $\beta>\beta_{T_{\mathrm{dS}}}>\longrightarrow$ Broken de Sitter $\longrightarrow \Omega_{|\mathbf{k}|}=\omega_{|\mathbf{k}|}\left(|c|^{2}+|s|^{2}\right)$ $\kappa \rightarrow \Lambda=\kappa\left(1+2 \frac{e^{-2 x \kappa}}{1-e^{-2 x \kappa}}\right)=\kappa \operatorname{coth}(x \kappa)$

## THE COSMOLOGICAL OBSERVABLES

- $x=\frac{\pi H}{2 \pi T}$, for $x \in[\pi, \infty)$. When $x=\pi$, admits its natural dS value where $T=T_{\mathrm{dS}}$
- The transformed state has reduced isometry than Bunch-Davies

$$
\ddot{\phi}+2 \mu \dot{\phi}+\left(\mu_{H}^{2}+\xi \frac{\mathcal{R}}{H^{2}}\right) a^{2} H^{2} \phi=0, \quad \dot{H}=\not \frac{1}{2 a} \dot{\phi}^{2}=\text { const } .
$$

- The limiting cases

$T<T_{\mathrm{dS}}, \Lambda \rightarrow$ finite
$\kappa \rightarrow$ finite

Scale invariance is slightly broken

$$
T=T_{\mathrm{dS}}, \Lambda \rightarrow \infty, \kappa \rightarrow i
$$

Scale invariance (like symmetry restoration)

## THE COSMOLOGICAL OBSERVABLES

- The spectral index of scalar curvature fluctuations, $n_{S}$, is shifted due to finite temperature effects

- All the freedom is included in $\Lambda$ which admits its natural value when $x \approx \pi$

$$
n_{S, \beta}=1+\frac{d \ln \left(|\mathbf{k}|^{3} P_{S, \beta}\right)}{d \ln |\mathbf{k}|}<\delta n_{S} \equiv n_{S, \beta}-1=-\frac{2 x}{\Lambda}\left[\frac{e^{-x \Lambda}}{1-e^{-2 x \Lambda}}\right]
$$

## THE COSMOLOGICAL OBSERVABLES

- The shift is extended to other observables

$$
n_{S, \beta}^{(1)}=\delta n_{S}\left[2-\frac{1}{\Lambda^{2}}-\frac{x}{\Lambda}\left(1+\frac{2 e^{-2 x \Lambda}}{1-e^{-2 x \Lambda}}\right)\right]
$$

$$
\begin{gathered}
n_{S, \beta}^{(1)}=\frac{d n_{S, \beta}}{\left.d \ln \left|\mathbf{k}_{1}\right|\right)},{ }_{2}^{2} n_{S, \beta}^{(2)}=\frac{d n_{S, \beta}^{(1)}}{d \ln |\mathbf{k}|} \quad f_{N L}=\frac{5}{6} \frac{N_{\rho \rho}}{N_{\rho}^{2}} \\
n_{S, \beta}^{(2)}=\frac{\left(n_{S, \beta}\right)^{2}}{\delta n_{S}}+\delta n_{S}\left[-\frac{2}{\Lambda^{2}}+\frac{2}{\Lambda^{4}}-\frac{x}{\Lambda}\left(2-\frac{1}{\Lambda^{2}}\right)\left(1+\frac{2 e^{-2 x \Lambda}}{1-e^{-2 x \Lambda}}\right)+\frac{4 x^{2}}{\Lambda^{2}} \frac{e^{-2 x \Lambda}}{\left(1-e^{-2 x \Lambda}\right)^{2}}\right] \\
N_{\rho}=\frac{\partial N}{\partial \rho}, N_{\rho \rho}=\frac{\partial^{2} N}{\partial \rho^{2}} \text { and } \rho \equiv P_{S, \beta}
\end{gathered}
$$

## THE COSMOLOGICAL OBSERVABLES

- The physical case $\Lambda \rightarrow 1.5117, x \rightarrow \pi$

$$
\begin{gathered}
n_{S, \beta} \equiv n_{S} \approx 1-0.036=0.964 \\
(0.9649 \pm 0.0042)
\end{gathered}
$$

| $n_{S, \beta}^{(1)} \approx 0.0186$ |
| :---: |
| $(0.013 \pm 0.012)$ |

$$
\begin{array}{|c|}
\hline f_{N L} \approx-1.7138 \\
(-0.9 \pm 5.1) \\
\hline
\end{array}
$$

$$
\begin{gathered}
n_{S, \beta}^{(2)} \approx 0.1250 \\
(0.022 \pm 0.012)
\end{gathered}
$$

| $\Lambda$ | $x$ |
| :---: | :---: |
| $\rightarrow 0$ | $\rightarrow \infty$ |
| $10^{-6}$ | $3.5 \cdot 10^{7}$ |
| 0.01 | 1600 |
| 0.5 | 14.8 |
| $\rightarrow 1.5117$ | $\rightarrow \pi$ |

$$
\Lambda=\kappa\left(1+2 \frac{e^{-2 x \kappa}}{1-e^{-2 x \kappa}}\right)=\kappa \operatorname{coth}(x \kappa)
$$

Planck Collaboration, r. Akrami et al., Astron. Astrophys. 641 (2020)

## SPECTRAL INDEX AND dS/CFT

- The dS/CFT correspondence

4d Bulk: $\mid$ in $>\longrightarrow \mid$ out, $\beta_{T_{\mathrm{dS}}}>\longleftrightarrow$ 3d Boundary: UV to IR RG flow

M. Bianchi, D.Z. Freedman and K. Skenderis Nucl. Phys. B 631 (2002) 159
I. Antoniadis, P. O. Mazur and E. Mottola, JCAP 09 (2012) 024

## SPECTRAL INDEX AND dS/CFT

- The $\mathrm{d}=3$ scalar theory of the Ising field $\sigma$

$$
\mathcal{L}=\frac{1}{2} \partial_{i} \sigma \partial_{i} \sigma-\lambda \sigma^{4}
$$

The IR limit is a exact 3d CFT as long as the BT preserves the $S O(4)$ isometry.

Scale invariance is broken via the Coleman-Weinberg mechanism.
$R G$ brings us in the vicinity of the IR fixed point

$$
\mid \text { out; } \beta\rangle \text { with } \beta>\beta_{\mathrm{dS}}
$$

## SPECTRAL INDEX AND dS/CFT

- In the dS/CFT correspondence: bulk field $\phi\left(\Delta_{-}\right)$dual to a boundary operator $\mathcal{O}\left(\Delta_{+}\right)$

$$
\begin{gathered}
\Delta_{-}=\frac{d}{2}-\nu \quad \Delta_{+}=\frac{d}{2}+\nu \\
\left(\Delta_{-}, \Delta_{+}\right)_{\mathrm{cl}}=(0,3)
\end{gathered}
$$

- Bulk and boundary propagators are related by

7. Maldacena, 7. High Energy Phys. 05 (2003) 013
8. M. Maldacena and G. L. Pimentel, JHEP 09 (2011) 045

## SPECTRAL INDEX AND dS/CFT

- There is a gauge of the metric where $\zeta_{\mathbf{k}}=z(\tau) \phi_{\mathbf{k}}$

7. Maldacena, 7. High Energy Phys. 05 (2003) 013
8. M. Maldacena and G. L. Pimentel, HEP 09 (2011) 045

- Then bulk and boundary propagator connection reforms to

$$
\left\langle\zeta_{|\mathbf{k}|} \zeta_{-|\mathbf{k}|}\right\rangle \sim \frac{1}{\left\langle\mathcal{O}_{|\mathbf{k}|} \mathcal{O}_{-|\mathbf{k}|}\right\rangle}
$$

## SPECTRAL INDEX AND dS/CFT

- The spectral index in holography

$$
\begin{aligned}
n_{S}-1 & =\frac{d}{d \ln |\mathbf{k}|}\left[\ln \left(|\mathbf{k}|^{3} P_{S, \beta}\right)\right]=\frac{d}{d \ln |\mathbf{k}|} \ln \left(|\mathbf{k}|^{3}\left\langle\zeta_{|\mathbf{k}|} \zeta_{-|\mathbf{k}|}\right\rangle\right) \\
& =3-\frac{1}{\left\langle\mathcal{O}_{|\mathbf{k}|} \mathcal{O}_{-|\mathbf{k}|}\right\rangle}\left(\frac{d}{d \ln |\mathbf{k}|}\left\langle\mathcal{O}_{|\mathbf{k}|} \mathcal{O}_{-|\mathbf{k}|}\right\rangle\right)
\end{aligned}
$$

- The Callan-Symanzik

$$
\begin{array}{r}
\left(\frac{\partial}{\partial \ln |\mathbf{k}|}-\beta_{\lambda} \frac{\partial}{\partial \lambda}+\left(3-2 \Delta_{\mathcal{O}}\right)\right)\left\langle\mathcal{O}_{|\mathbf{k}|} \mathcal{O}_{-|\mathbf{k}|}\right\rangle=0 \quad \Delta_{\mathcal{O}}=\Delta_{+}=\left[\Delta_{\mathcal{O}}\right]+\Gamma_{\mathcal{O}} \text { and } \beta_{\lambda} \equiv \mu \frac{\partial \lambda}{\partial \mu} \\
\begin{array}{r}
n_{S}=1-2 \Gamma_{\mathcal{O}}-\beta_{\lambda} \frac{\partial}{\partial \lambda} \ln \left\langle\mathcal{O}_{|\mathbf{k}|} \mathcal{O}_{-|\mathbf{k}|}\right\rangle \\
\text { F. Larsen and R. McN Nees, fHEP } 07 \\
\text { (2003) 051 }
\end{array} \\
\text { F. P. van der Schaar, FHEP } 01 \text { (2004) }
\end{array}
$$

## SPECTRAL INDEX AND dS/CFT

- The anomalous dimension

| $\gamma_{\mathcal{O}} \equiv \mu \frac{\partial}{\partial \mu} \ln z_{\mathcal{O}}$ |  | $\gamma_{\sigma} \equiv \frac{1}{2} \mu \frac{\partial}{\partial \mu} \ln Z_{\sigma}$ |
| :--- | :--- | :--- |
|  | $\Gamma_{\mathcal{O}}=-\gamma_{\mathcal{O}}+2 \gamma_{\sigma}$ |  |
|  |  |  |

- For $\mathcal{O}=\sigma^{4}\left(\Delta_{\sigma^{4}}=3\right)$ no shift to the spectral index

$$
n_{S}=1-2 \Gamma_{\sigma^{4}}=1-2 \frac{\partial \beta_{\lambda}}{\partial \lambda}
$$

F. Larsen and R. McNees, JHEP 07 (2003) 051
7. P. van der Schaar, 7HEP 01 (2004)

070

- For us $\mathcal{O}=\Theta \equiv \delta^{i j} T_{i j}\left(\Delta_{\Theta}=3\right)$ and the spectral index

## a conserved current

$$
\Gamma_{\Theta}=0 \longrightarrow n_{S}=1+\frac{\partial}{\partial \ln \mu} \ln \left\langle\Theta\left(x_{1}\right) \Theta\left(x_{2}\right)\right\rangle=1-\beta_{\lambda} \frac{\partial}{\partial \lambda} \ln \left\langle\Theta\left(x_{1}\right) \Theta\left(x_{2}\right)\right\rangle
$$

## SPECTRAL INDEX AND dS/CFT

- Vanishing of the anomalous dimension of $\Theta$

$$
\langle\Theta \Theta\rangle=c_{\Theta} /|x|^{2 d}
$$

- Non-trivial vanishing for $\Gamma_{\Theta}=0 \rightarrow \gamma_{\Theta}=2 \gamma_{\sigma}$
K. G. Wilson, Phys. Rev. 179, 1499
S. E. Derkachov, 7.A. Gracey, A.N. Manashov, Eur. Phys. 7. C2 569-579
C. Coriano, L. Delle Rose and K. Skenderis, Eur. Phys. 7. C 81 2, 174

7. Henriksson, ArXiv: 2201.09520

A sunset-like diagram with $\sigma \square \sigma$ insertion cancels the usual sunset

- Near the IR Wilson-Fisher fixed point $2 \gamma_{\sigma}=\eta$ the Ising field critical exponent

## SPECTRAL INDEX AND dS/CFT

- Rewrite the Callan- Symanzik equation for $\Theta$ and $\Gamma_{\Theta}=\eta-\eta$

$$
\left[\left(\frac{\partial}{\partial \ln \mu}+\eta\right)+\left(\beta_{\lambda} \frac{\partial}{\partial \lambda}-\eta\right)\right]\left\langle\Theta\left(x_{1}\right) \Theta\left(x_{2}\right)\right\rangle \simeq 0
$$

- Very close to the IR Wilson-Fisher fixed point $\beta_{\lambda}^{2} \ll \frac{\partial \beta_{\lambda}}{\partial \lambda}$

$$
\left(\beta_{\lambda} \frac{\partial}{\partial \lambda}-\eta\right)\left\langle\Theta\left(x_{1}\right) \Theta\left(x_{2}\right)\right\rangle \simeq 0
$$

- The $c_{\Theta}$-coupling satisfies the scaling equation

$$
\beta_{\lambda} \partial_{\lambda} c_{\Theta}=\eta c_{\Theta}
$$

## SPECTRAL INDEX AND dS/CFT

- The approximate conformal 2-point function

$$
\langle\Theta \Theta\rangle=c_{\Theta} /|x|^{2 d} \quad c_{\Theta} \sim\left(\frac{16 \pi^{2}-3 \lambda}{\lambda}\right)^{\eta}
$$

- The critical exponent $\eta$ non-perturbatively admits the numerical value $\eta \approx 0.036$ (MC simulation)

$$
n_{S}=1-\beta_{\lambda} \frac{\partial}{\partial \lambda} \ln \left\langle\Theta\left(x_{1}\right) \Theta\left(x_{2}\right)\right\rangle
$$

$$
n_{S} \simeq 1-\eta \quad n_{S} \simeq 1-0.036=0.964
$$

- So $\Lambda \approx 1.5117$ is indeed fixed independently (without connection to the inflationary characteristics)

## SPECTRAL INDEX AND dS/CFT

- $Z_{\sigma}$ cannot be decoupled justifying the existence of the eigenvalue equation
- The justification from boundary arguments

Renormalized $\Theta$ comes from

$$
\begin{gathered}
\Theta \equiv-\beta_{\lambda} \mu^{\varepsilon} \sigma^{4} \\
Z \cap=1
\end{gathered} \longrightarrow \Theta=\Theta_{0} z_{\Theta}^{-1 / 2} \quad \longrightarrow \quad\left(\mu \partial / \partial \mu+\gamma_{\Theta}\right)\langle\Theta \Theta\rangle=0
$$

- From bulk arguments

Connect bulk and boundary w/o forgetting $Z_{\sigma}$

$$
\begin{gathered}
\longrightarrow \mu=a H \text { and } \lambda=\phi \longrightarrow \lambda=\phi-\frac{2 \gamma_{\sigma}}{\beta_{\lambda}} H t \simeq \phi+\ln (H|\tau|)^{\frac{2 \gamma_{\sigma}}{\beta_{\lambda}}} \\
\downarrow \downarrow
\end{gathered}
$$

## CONCLUSIONS

- We considered a thermal scalar in de Sitter background. Starting from the Bunch-Davies |in $>$ vacuum, a Bogolyubov Transformation placed us somewhere in the interior of the finite temperature phase diagram.
- The BT rotation is considered in such a way that instead of returning to the BD vacuum we landed on the |out > vacuum, which is connected to an interacting IR CFT, in the universality class of the 3d Ising model.
- This interacting CFT is rather special, in the sense that the boundary operator that couples to the scalar curvature perturbations in the bulk has a classical scaling dimension. The critical exponent $\eta$ is the order parameter of the breaking of the scale invariant spectrum of curvature fluctuations
- $\eta$ fixes the parametric freedom in the dS scalar theory, yielding the prediction $n_{S, \beta} \approx 0.964$, up to errors associated with its lattice Monte Carlo measurements.
- Heating up the system $T \lesssim T_{\mathrm{dS}}$ numerically in a controlled way we evaluated additional cosmological observables $n_{S, \beta}^{(1)}, f_{N L}$ and $n_{S, \beta}^{(2)}$. We finally note that our predicted values of $n_{S, \beta}, n_{S, \beta}^{(1)}$ and $f_{N L}$ are well within current experimental bounds while $n_{S, \beta}^{(2)}$ exceeds them.

## THANK YOU
